

Snow Drift Surveys

Summit Station, 2007-2012

Prepared by Amy Burzynski and Stephen Newman
Engineering for Polar Operations, Logistics, and Research (EPOLAR) Program
U.S. Army Cold Regions Research and Engineering Laboratory (ERDC-CRREL)

For the National Science Foundation, Office of Polar Programs
Arctic Research Support and Logistics Program

January 2013

**US Army Corps
of Engineers®**

Methods

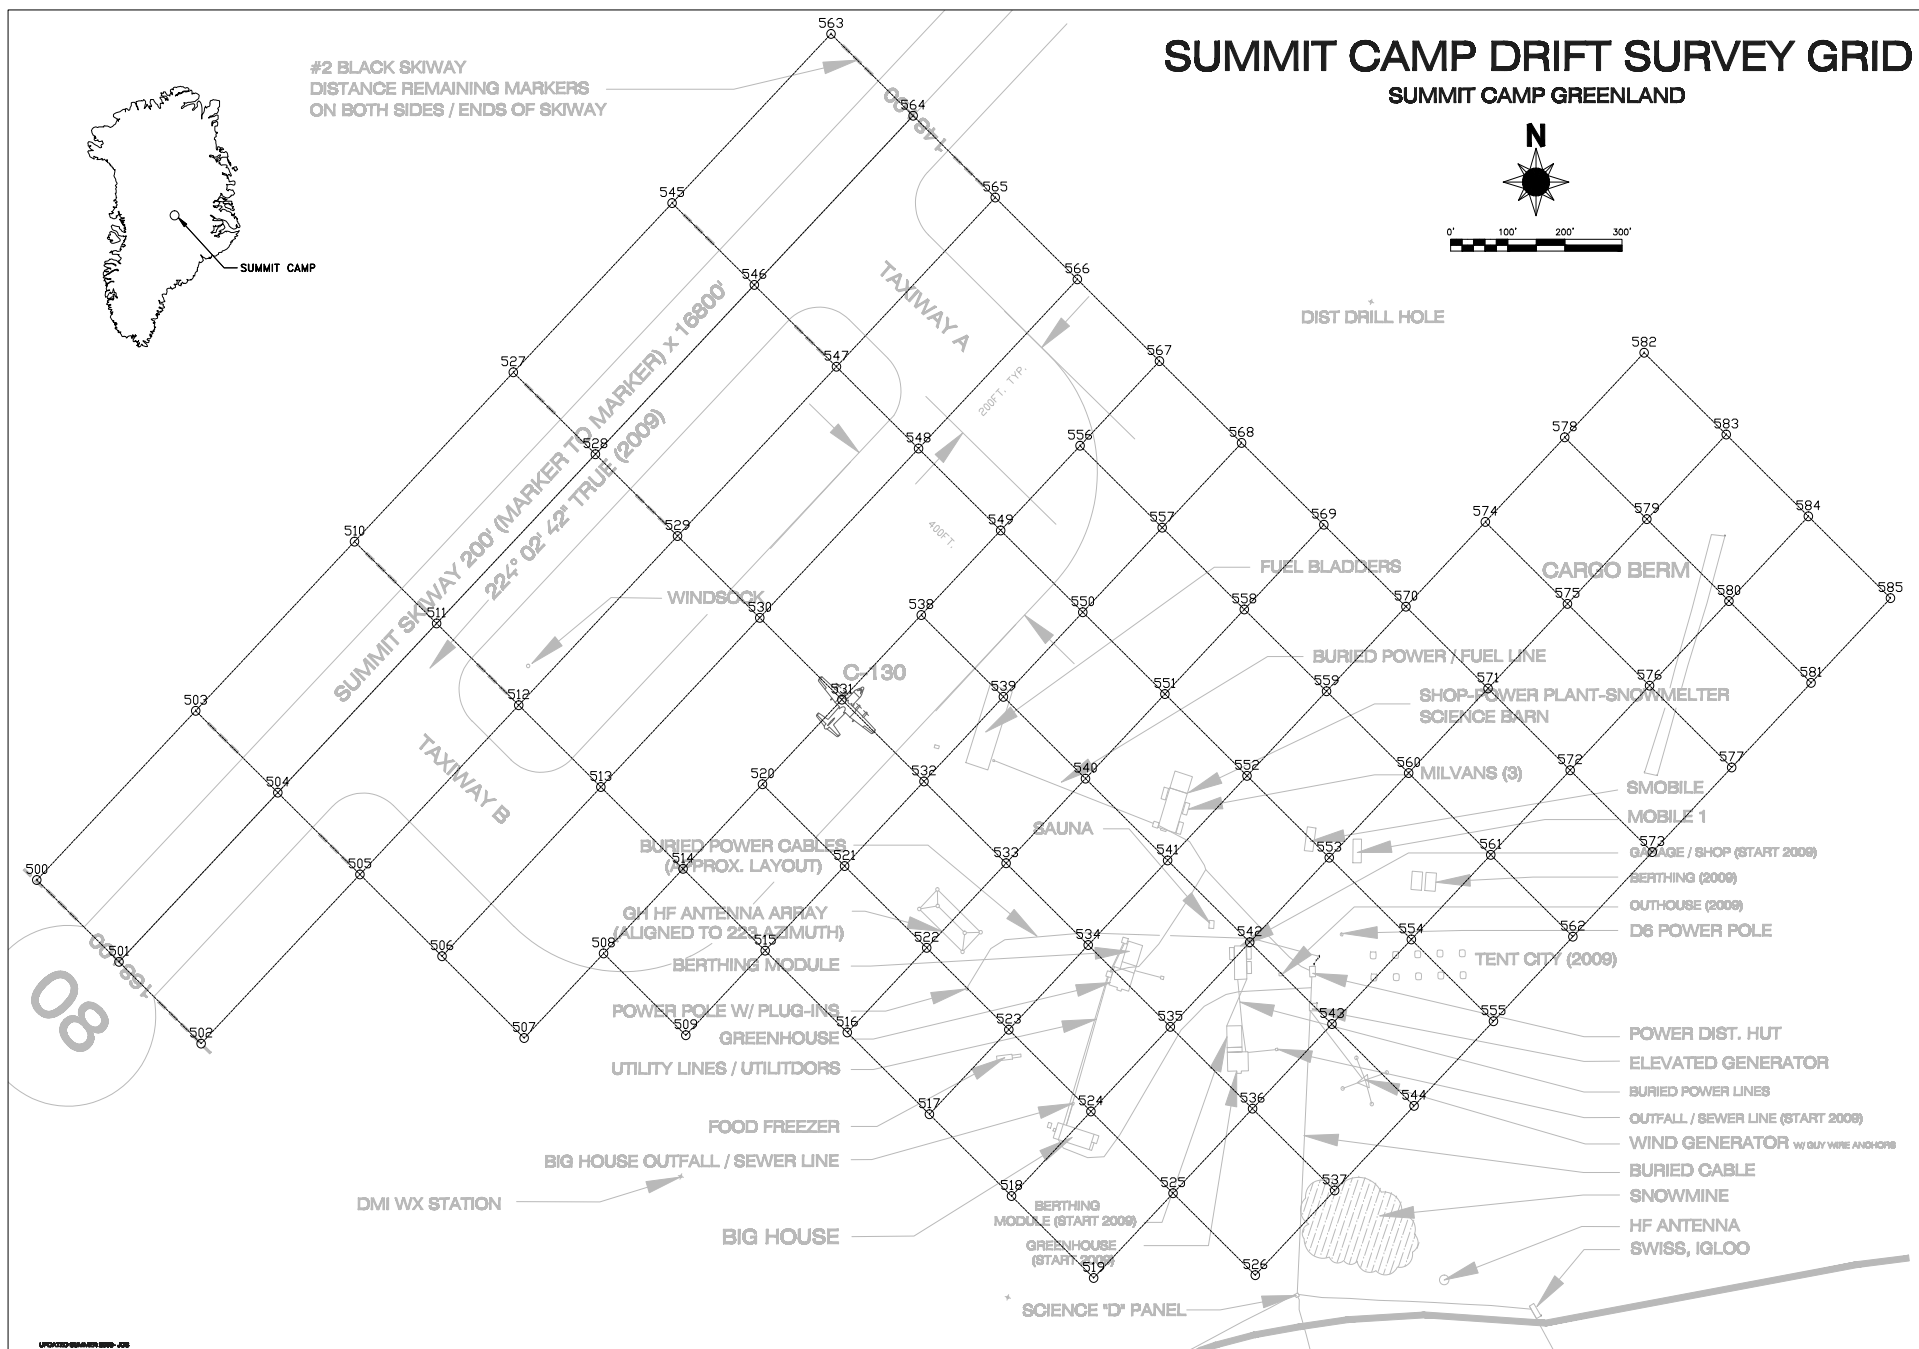

Snow elevation surveys were collected with a Trimble GPS.

Surveys were converted to point shapefiles then interpolated into 3x3m grids using Inverse Distance Weighting (IDW) in ArcGIS.

A grid was provided to guide initial surveys but was not followed closely; data points were often collected in different locations each time (Prior to 10/27/10).

In October 2010 the surveys began to follow a different approach; data was collected along a serpentine pattern throughout the main camp area.

Initial survey grid, replaced by a serpentine survey method in Oct. 2010
