Hi Heather and Marissa,

There are a few steps - first you need to install RealPort on the computer. This is how the data stream gets fed onto Port 5 (or whatever port you specify). On the NOAA Met network folder, there should be a folder named "Realport". Run the program and fill in the following info:

- Add a new device
- Searching (will change to "Not listed")... choose "Not listed" and hit "Next"
- Device Model Name: NOAA Met UDP
- IP: 192.168.1.65
- Default Network Profile - switch to UPD
- Port 2101 stays
- # of ports = 1
- Starting COM = 5 (or whatever you choose. this is 5 on the other computers)
- Finish

Once your Realport is set up, you can install TerraTerm and start it up like normal (selecting Com 5. Terra Term's setup file is also in the Met network/ftp folder.

Let us know if anything isn't clear or if you have questions.

Christy & Andy

Hey,

I'm working on getting the new TAWO computer set up and I wanted to get terra term set up so we could see the met data from TAWO.... we've poked around a bit but no luck, how can we get that set up?

Thanks,

Marissa and Heather
